

# Apache Aurora

## an Introduction

10.11.2015  
@ErbStephan

## **Apache Aurora**

*Mesos framework for the deployment and scaling of stateless and fault tolerant services in a datacenter*

## **Apache Mesos**

*Cluster manager providing fault-tolerant, fine-grained multitenancy via containers*

## **Apache Aurora**

*„distributed supervisord“*

**I speak ansible and deploy  
VMs for breakfast...**

**...why  
should I  
care?**

Apps/Services

static  
hostfile

Hosts/VMs

## Aspects

- Configuration/package management
- Deployment
- Naming/discovery
- Monitoring

## Aspects

- Configuration/package management
- Deployment
- Naming/discovery
- Monitoring

## Challenges

- Failures
- Maintenance
- Utilization
- Scaling (instances + teams)

Apps/Services

Cluster Manager

Apps/Services

Cluster Manager

**User**  
**perspective**  
(above the fold)

## File `webserver.aurora`:

```
server = Process(  
    name = 'simplehttp',  
    cmdline = 'python -m SimpleHTTPServer {{thermos.ports[http]}}'  
)  
task = SequentialTask(  
    processes = [server],  
    resources = Resources(cpu=2, ram=2*GB, disk=4*GB)  
)  
jobs = [  
    Service(  
        task=task,  
        constraints = {'host': 'limit:1'},  
        instances=4,  
        cluster='rz1', role='www', environment='test', name='webserver'  
    ),  
]
```

## Commandline Usage:

```
$ aurora update start rz1/www/test/webserver webserver.aurora
```

# Aurora Job UI

Active tasks (4)

Completed tasks (27)

All tasks

## Configuration Overview

0-3

[show config](#)

Instance	Status	Host
0	<div><div>17 days ago - RUNNING</div><div><div>10/23 14:02:39 LOCAL</div><div>PENDING</div></div><div><div>10/23 14:02:39 LOCAL</div><div>ASSIGNED</div></div><div><div>10/23 14:02:40 LOCAL</div><div>STARTING</div><div>Initializing sandbox.</div></div><div><div>10/23 14:02:41 LOCAL</div><div>RUNNING</div></div></div>	<div>1 farm node 4 bits local</div>
1	<div><div>11 minutes ago - RUNNING</div></div>	<div>1 farm node 4 bits local</div>
2	<div><div>11 minutes ago - RUNNING</div></div>	<div>1 farm node 4 bits local</div>
3	<div><div>11 minutes ago - RUNNING</div></div>	<div>1 farm node 4 bits local</div>

# Instance Monitoring

(e.g. via Prometheus)

# User-centric Features

- long-running services
- cron jobs
- adhoc jobs
- rolling job updates, with automatic rollback
- service announcement in ZooKeeper
- scheduling constraints
- Python-based configuration language
- Docker support (optional)

**Operator  
perspective**  
(below the fold)

# Maintenance API

```
$ aurora_admin host_deactivate --filename=hosts.txt rz1
```

```
$ aurora_admin host_drain --filename=hosts.txt rz1
```

```
$ aurora_admin host_activate --filename=hosts.txt rz1
```

# Cluster-wide Monitoring

(e.g. via Prometheus)

# Operator-centric Features

- high-availability
- multi-user support
- maintenance primitives (SLA-based)
- resource quotas and preemption
- instrumented for monitoring and debugging

# **Implications**

(good and bad)

## **Opinionated Design**

- Services are stateless  
(as they should be...)
- No snowflake machines  
(unless...)

**Enforces best practices  
but does not fit every  
usecase**

## **Gutefrage.net**

- 6 nodes

## **Twitter**

- 10.000s nodes per cluster
- 40% of their data center

# Highly fault-tolerant but not foolproof

**Stephan Erb** @ErbStephan · 21. Okt.

Uuups. [@ApacheMesos](#) deploy vs me 1:0. "Slave asked to shut down by master because 'Slave is not authenticated'"
